THESIS ABSTRACT **Paper I:** “A Network Model of Wealth Inequality and Financial Instability” [Job Market Paper]

We propose a theoretical network model for understanding the relationship between wealth inequality and financial instability. Financial assets link individuals to form a network. Its topology varies with the level of wealth inequality or total wealth and determines network stability in the event of an income shock. Simulations demonstrate that increasing wealth inequality, measured by the skewness of the financial network's degree distribution, makes the network less stable, measured by the share of individuals failing financially. Aggregate wealth has an inverted U-shaped effect on the

model’s network stability. Implications of the theoretical model are tested empirically on long-run panel data for nine countries with a reduced form, two-way fixed effects model. Estimates suggest that increasing wealth inequality, in an economy with high levels of aggregate wealth as measured by the wealth-income ratio, significantly increases the likelihood of financial crises, particularly stock market crashes.

Paper II: “Instability, Credit, and Inequality in the United States Since 1913”

A methodological application of the cointegrated VAR model, we test multiple hypotheses concerning long-run relationships between inequality, credit, and financial instability in the United States since 1913. The central role of abnormal credit growth in financial crises is well defined (e.g. Kindleberger and Minsky), thus we test if this relationship holds statistically, and then expand the model to test if either income or wealth inequality is also a long-run determinant of credit growth. A breadth of data is applied, and competing VAR systems tested, to bolster the apparent theoretical foundation of any statistical results.

Paper III: “Re-examining the Inequality and Growth Relationship: Evidence from CPS Reported Weekly Earnings Data”

We propose an identification strategy that exploits reported household earnings in monthly CPS Basic surveys to study the relationship between inequality and growth. We study between-industry and occupation variation in earnings inequality and its subsequent impact on between-industry or occupation production growth rates.
